

write a python code to get a input string from a user and store it in a list
Provide only the code with proper indentation and comments. Be concise and direct.

```
# Get input string from user and store it in a list
# Ask the user to input a string
input_string = input("Please enter a string: ")

# Store each character of the input string in a list
string_list = list(input_string)

# Print the list for confirmation
print("The string you entered is stored in the following list: ", string_list)
```

This code will ask the user to input a string, store each character of the input string in a list, and then print the list for confirmation.
